Title: REFRIGERATION DEVICE COMPRISING  
CONTROLLED DE-HUMIDIFICATION

Commissioner for Patents  
PO Box 1450  
Alexandria, VA 22313-1450

**INFORMATION DISCLOSURE STATEMENT**

Sir:

In accordance with 37 C.F.R. 1.98, I am submitting a completed "INFORMATION DISCLOSURE STATEMENT BY APPLICANT" (*Form PTO/SB/08A*) with patents and/or publications as delineated therein attached.

DE 39 04216 discloses that, to control the cool-space temperature of a refrigerator which is designed with a normal refrigerator section (1) and a freezer section (2), a one-circuit refrigerant circulation, a compressor refrigeration unit (3), a condenser (6), a throttle member and in each case an evaporator part (4, 5) for the freezer section and the normal refrigerator section. An electronic control unit (8) ensures the regulation of the temperature of the interior space, a temperature sensor (9) being arranged in the normal refrigerator section (1) and a further temperature sensor (11) in the freezer section (2). The microprocessor-controlled control unit (8) is supplied with the temperature values from the interior space of the normal refrigerator section (1), directly from the evaporator part (4) of the normal refrigerator section (1), and from the interior space of the freezer section (2). When the temperature in the freezer section (2) exceeds a predetermined value, a recirculation air blower (12) is switched on for circulating the air in the normal refrigerator section (1). As a result, the temperature in the freezer section (2) is always held at permissible temperature values even in the case of extremely unfavourable outside temperatures or when the user has preset the desired value at a value which is too high.

JP 2 17375 discloses that to reduce a load applied on a compressor and restrain the electric power consumption of the compressor by a method wherein the operating frequency

ALL REFERENCES CONSIDERED EXCEPT WHERE LINED THROUGH. /C.B./

of a fan is increased stepwisely upon driving the compressor when an energy saving mode button is actuated. An operation panel 4 is provided with an energy saving mode button, transmitting a signal to a control device 5 upon driving a compressor 7 so that the operating frequency of a fan motor device 8 supplying cold air produced in an evaporator into respective food storage chambers is increased stepwisely. When the energy saving mode button 4e is actuated, the fan motor device 8 is controlled by a timer 5a accommodated in the control device 5 so as to increase the operating frequency thereof stepwisely even when the compressor 7 is actuated. According to this method, the operating frequency of the fan is changed in accordance with the amount of refrigerant sent into the evaporator whereby a load applied on the compressor may be reduced and the electric power consumption of the compressor may be restrained.

JP 1 222177 discloses a process to reduce noise in an arbitrary time band where it is not used frequently, by operating a timer function on the handling of a 'silence' pushbutton switch, and lowering the operation frequency of a fan motor device, which drives a fan, for a specified period of time. During a normal operation status of an electric refrigerator, a judgment is made as to whether or not a silence pushbutton switch 4e is depressed. When the silence button switch 4e remain OFF, an ordinary operation is executed while a timer function 5a is set when the pushbutton switch 4e is in ON status. Then, the operation frequency of a fan motor device 7 is lowered by the inverter system identical to the control of a compressor 6. Then, a judgment is made as to whether the silence button switch is ON status or not. The release of the silence by OFF status is executed by depressing the pushbutton switch 4e again. When the silence is released, normal operation starts. When the silence is not released, a judgment is made as to whether a specified period of time passes or not based on the timer function 5a. The operation frequency of the fan motor device 7 remains low until the timer function 5a is timed up. It is, therefore, possible to reduce the noise produced by a fan 7a compared with the normal operation.

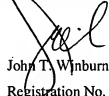

DE 101 39 834 discloses that the invention relates to a refrigeration device comprising two temperature zones (1, 2) that are cooled by condensers (5, 4), arranged in a common coolant circuit, a first (1) of said zones being equipped with a fan (9). In said device, to maintain the temperatures of the temperature zones (1, 2) within their respective target ranges, the refrigeration circuit is operated intermittently, depending on a temperature that is measured in one of the temperature zones. The fan (9) is also operated intermittently, whereby the operational and non-operational phases of the coolant circuit and the fan are determined in such a way that operational phases of the coolant circuit at least partially coincide with non-operational phases of the fan (9).

AP13 Rec'd PCT/PTO 09 DEC 2005

EP 0 949 468 discloses that the actual operating parameter value for a refrigeration compressor is compared with a stored parameter value for controlling operation of an air circulating fan for a higher temperature refrigeration compartment. The control method uses an electronic control device for comparing at least one required parameter value held in a data memory with an actual parameter value obtained from the operation of the refrigeration compressor, e.g. the summated compressor running time., to provide a control signal for operation of a circulation fan, used for controlling the temperature within a higher temperature refrigeration compartment by circulation of the cooling air.

If no translation of pertinent portions of any foreign language patents or publications mentioned within the "INFORMATION DISCLOSURE STATEMENT BY APPLICANT" is included with the aforementioned copies of those applications, patents and/or publications, it is because no existing translation is readily available to the Applicant. As per the Notice in 1273 OG 55 (August 5, 2003) no copies of any above-mentioned US patents and US patent application publications are submitted for this application which was filed after June 30, 2003.

Respectfully submitted
